Linear transformation should be introduced in early chapters as opposed to near the end of the book. The book is very detailed for the first 3 or 4 chapters. Then from time to time you feel there are some gaps you have to fill in with your own proof if you can. Could've done a better job.

was introduced through systems of linear equations and matrices. In modern mathematics, the presentation through vector spaces is generally preferred, since it is more synthetic, more general (not limited to the finite-dimensional case), and conceptually simpler, although more abstract. A vector space over a field F (often the field of the real

The row picture for $T A = I$ has 3 perpendicular planes $x = 2$ and $y = 3$ and $z = 4$. Those are perpendicular to the x and y and z axes: $z = 4$ is a horizontal plane at height 4. The column vectors are $i = (1,0,0)$ and $j = (0,1,0)$ and $k = (0,0,1)$. Then $b = (2,3,4)$ is the linear combination $2i + 3j + 4k$.
