Kinematic equations relate the variables of motion to one another. Each equation contains four variables. The variables include acceleration (a), time (t), displacement (d), final velocity (v_f), and initial velocity (v_i). If values of three variables are known, then the others can be calculated using the equations.

Equations of Motion. Okay, enough of the definitions. Let's see how these things all fit together, and how they can be used. What we will be looking at are called the equations of motion, and this topic is often referred to as kinematics. It is important to note that we are not yet dealing with causes for these motions, but only the motions themselves.

Mechanics can be divided into 2 areas - kinematics, dealing with describing motions, and dynamics, dealing with the causes of motion. In Physics 1, we try to "cover" mechanics in 1-4.5 week cycle. Obviously, lots of things are going to get left out or glossed over, but turning out mechanical engineers is not the goal in Physics 1!

This physics course is the first in a series of four modules that covers calculus-based mechanics. This module reviews kinematics (the geometrical description of motion) in the context of one-dimensional, multi-dimensional, and circular motion. It also reviews Newton's laws of motion and examines their application to a wide variety of cases.

Kinematics is used in astrophysics to describe the motion of celestial bodies and systems; and in mechanical engineering, robotics and biomechanics to describe the motion of systems composed of joined parts (such as an engine, a robotic arm, or the skeleton of the human body). A formal study of physics begins with kinematics.
