Minerals In Thin Section - ftik.usm.ac.id

In optical mineralogy and petrography, a thin section (or petrographic thin section) is a laboratory preparation of a rock, mineral, soil, pottery, bones, or even metal sample for use with a polarizing petrographic microscope, electron microscope and electron microprobe. A thin sliver of rock is cut from the sample with a diamond saw and ground optically flat.

Darren has been making thin sections for over 15 years and specialises in polished thin sections that are electron microprobe ready, as well as being the correct thickness for reflected light microscopy. His lab utilises the most modern equipment and his sections are always even, well polished and the correct thickness.
