An optical illusion is something that plays tricks on your vision. Optical illusions teach us how our eyes and brain work together to see. You live in a three-dimensional world, so your brain gets clues about depth, shading, lighting, and position to help you interpret what you see.

Optical Illusions | National Eye Institute

The Visual System Is Made Of Many Moving Parts While your eyes play an important role in vision, they are only one component of a larger visual system that includes many different parts such as the optic nerve, the optic chiasm and the visual cortex of the brain, to name a few. We see when light enters our eyes and is focused onto the retina.

Optical Illusions: More Than Meets The Eye

The human eye is a relatively simple optical instrument. This limits the quality of the retinal image affecting vision. However, the neural circuitry seems to be exquisitely designed to match the otherwise limited optical capabilities, providing an exceptional quality of vision.

In Vision Optical . COVID 19 Update . The CDC and the AOA have eased their restrictions, and we are now back to providing routine care as well as urgent care. We have implemented new guidelines to keep patients, employees and doctors safer during this time:

In Vision Optical COVID-19

Eyes are organs of the visual system. They provide animals with vision, the ability to receive and process visual detail, as well as enabling several photo response functions that are independent of vision. Eyes detect light and convert it into electro-chemical impulses in neurons. In higher organisms, the eye is a complex optical system which collects light from the surrounding environment, regulates its intensity through a diaphragm, focuses it through an adjustable assembly of lenses to form

Eye - Wikipedia

Lens and retina The lens is behind the pupil. It focuses light onto the retina, the light-sensitive cells on the back of the eyeball. The retina converts images into electrical signals that are...
